What is OpenStreetMap?

- OpenStreetMap is the largest geo-reference open source database of the world
- The open database license (ODbL) allows free usage, changes and distribution under the same license.
- Open source tools for download and processing (Osmium, Osmosis, imposm, osm2pgsql, mkgmap, overpass-turbo, etc.)

Geofabrik

<http://download.geofabrik.de/>

OpenStreetMap Data Extracts

The OpenStreetMap data files provided on this server do **not** contain the user names, user IDs and changeset IDs of the OSM objects. These metadata fields contain personal information about the OpenStreetMap contributors and are subject to data protection regulations in the European Union. Please note that these regulations apply even to processing that happens outside the European Union because some OpenStreetMap contributors live in the European Union.

[Extracts with full metadata](#) are available to OpenStreetMap contributors only.

Welcome to Geofabrik's free download server. This server has data extracts from the [OpenStreetMap project](#) which are normally updated every day. Select your continent and then your country of interest from the list below. (If you have been directed to this page from elsewhere and are not familiar with OpenStreetMap, we highly recommend that you read up on OSM before you use the data.) This open data download service is offered free of charge by Geofabrik GmbH.

Willkommen auf dem Geofabrik-Downloadserver. Hier gibt es Daten-Auszüge aus dem [OpenStreetMap-Projekt](#), die normalerweise täglich aktualisiert werden. Wählen Sie aus dem Verzeichnis unten den Kontinent und ggf. das Land, für die Sie Daten benötigen. (Wenn Sie von anderswo auf dieser Seite gelandet sind und von OpenStreetMap nichts wissen, dann ist es empfehlenswert, sich mit dem Projekt vertraut zu machen, bevor Sie mit den Daten arbeiten.) Diese Downloads werden von der Geofabrik GmbH kostenlos angeboten.

Click on the region name to see the overview page for that region, or select one of the file extension links for quick access.

Sub Region	Quick Links

🇬🇧 Not what you were looking for? Geofabrik is a consulting and software development firm based in Karlsruhe, Germany specializing in OpenStreetMap services. We're happy to help you with data preparation, processing, server setup and the like. [Check out our web site](#) and contact us if we can be of service.

🇩🇪 Nicht das Richtige dabei? Die Geofabrik ist ein auf OpenStreetMap spezialisiertes Beratungs- und Softwareentwicklungsunternehmen in Karlsruhe. Gern helfen wir Ihnen bei der Datenaufbereitung, Datenkonvertierung, Serverinstallation und ähnlichen Aufgaben. [Besuchen Sie unsere Webseite](#) und sprechen Sie mit uns, wenn wir Ihnen helfen können.

Data in OSM

OSM data:

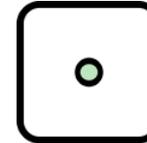

- 20 GB for Europa
- Accurate georeferencing
- Nodes, Ways, Relations
- Metainformation in key-value-pairs (Tags)

Example: gas data:

- „man_made = pipeline“
- „substance = gas“
- „pipeline = marker“
- „man_made = storage_tank“
- „man_made = gasometer“

OSM object types:

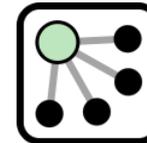

Nodes:

Ways:

Relations:

Tag: man_made=pipeline – Weitere Sprachen

ěština • Deutsch • English • polski • português • pyccckий • 日本語

Andere Sprachen • Übersetzen

Auszeichnung von Rohrleitungen für Wasser, Öl, Gas, Abwasser, Fernwärme usw. Die Rohrleitung kann sowohl über der Erde, unter der Erde, als auch unter Wasser verlegt sein. Zum größten Teil werden Pipelines zum Transport von Erdöl, Erdgas, Wasser und Abwasser (Kanal) verwendet.

Wie mappen?

Zeichne eine Linie und füge `man_made=pipeline` hinzu.

Tags, die in diesem Zusammenhang verwendet werden

Die folgenden Tags sind auch in Kombination mit `bridge=yes` für eine Rohrbrücke gebräuchlich:

Tag	Beschreibung
<code>name**</code>	Offizielle Name der Rohrleitung, z.B. "Westdeutsche Anbindungsleitung"
<code>ref**</code>	Verwende diesen Tag, wenn es eine kurze, eindeutige Kennung für diese Rohrleitung gibt z.B. "WEDAL". Dieser Wert wird verwendet, um Pipelines logisch miteinander zu verknüpfen. In der Regel enthalten bereits die Markierungslinien in den Rohrleitungen eine eindeutige Kennung.
<code>location**</code>	Dieser Tag gibt die Lage der Leitung an. Mögliche Werte: <ul style="list-style-type: none"> <code>location=underground</code> - für unterirdische, von der Oberfläche nicht sichtbare Rohrleitungen. <code>location=overground</code> - für Rohrleitungen an oder in der Nähe der Oberfläche. Einer Person oder einem Fahrzeug ist es nicht möglich, unter der Leitung hindurch zu kommen. <code>location=weibhead</code> - für Rohrleitungen an der Oberfläche. Sie befindet sich in einer Höhe, in der es Personen oder Fahrzeuge möglich ist, unter der Leitung hindurch zu kommen. Falls zutreffend sollten andere Tags wie <code>access=type=pipeline_orezhead</code> kombiniert werden. Wo die Überkopf-Rohrleitung die Handeschiffahrt (Kreuzung der Kanal- oder Flussschiffahrt) beeinflussen könnte, sollte die Verwendung von <code>access=type=pipeline_orezhead</code> geprüft werden. <code>location=underwater</code> - für Rohrleitungen unter der Oberfläche auf dem Grund von Gewässern wie Seen oder Flüssen. Für Rohrleitungen/Pipelines auf dem Meer sollte das <code>Seamark:Schema</code> (en) verwendet werden.

1.1 esy-osmfilter

esy-osmfilter is a Python library to read and filter OpenStreetMap data files in the Protocol Buffers (PBF) format and export them to a Python dictionary and/or JSON file.

The OpenStreetMap PBF format defines three primary data types:

- **Node**: An annotated point on Earth
- **Way**: An list of **Node** items forming a path or polygon
- **Relation**: A set of related entries

This library relies on the `esy.osm.pbf` library in order to read the pbf-files.

gitlab repository: <https://gitlab.com/dlr-ve-esy>

documentation: <https://dlr-ve-esy.gitlab.io/esy-osmfilter/>

1.1.1 Features

What it provides:

- A pythonic way to work with `.pbf` data file entries
- An efficient way to filter OpenStreetMap data with Python
- customisable filters
- improved performance by - parallization of the filtering process - storage and reuse of (intermediate) results with PICKLE and JSON

What it **doesn't** provide:

- A mechanism to spatially query OpenStreetMap entries.
- Visualization of OpenStreetMap data.

Workflow

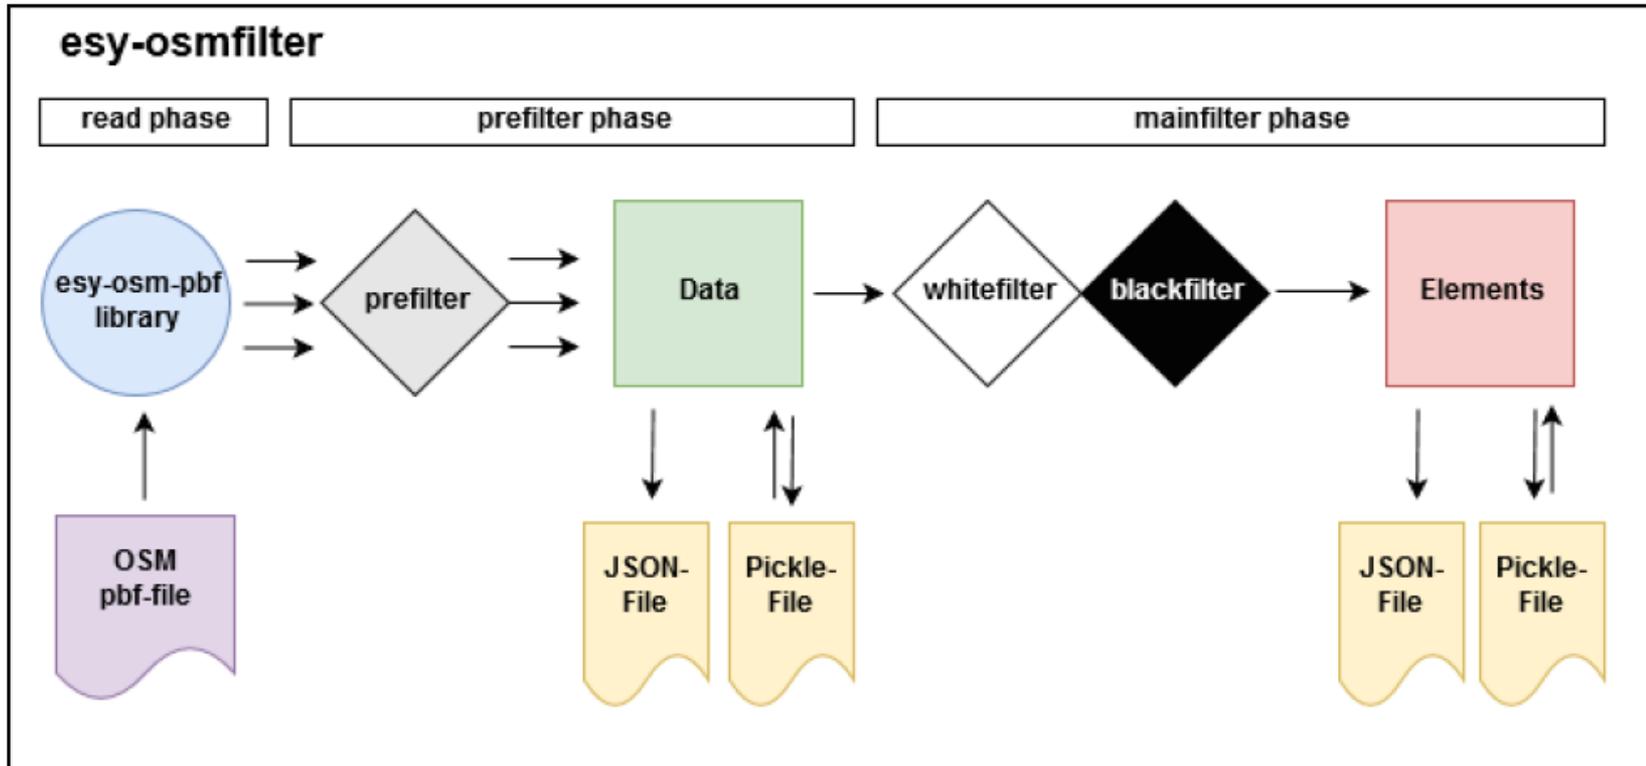

Fig.2: Working-flow of the esy-osmfilter library.

NOTE: Please upgrade pip first
`python -m pip install -upgrade pip`

1.1.2 Installation

`esy-osmfilter` depends on a Python version of 3.5 or above as well as on the Google Protocol Buffers. Use `pip` to install `esy-osmfilter`:

```
$ pip install esy-osmfilter
```

1.1.3 License

`esy-osmfilter` is licensed under the GNU General Public License version 3.0.

1.1.4 The Team

`esy-osmfilter` is developed at the DLR Institute of Networked Energy Systems in the department for Energy Systems Analysis (ESY).

Initialize esy-osmfilter

1.2 Usage

In the following example the prefilter of esy-osmfilter is used to extract all pipelines from Lichtenstein.

First, all necessary libraries and functions are imported.

```
>>> import configparser, contextlib
>>> import os, sys
>>> from esy.osmfilter import osm_colors as CC
>>> from esy.osmfilter import run_filter
>>> from esy.osmfilter import Node, Way, Relation
```

```
>>> import urllib.request
>>> if not os.path.exists('lichtenstein-latest.osm.pbf'):
...     filename, headers = urllib.request.urlretrieve(
...         'https://download.geofabrik.de/europe/liechtenstein-191101.osm.pbf',
...         filename='lichtenstein-191101.osm.pbf'
...     )
...     PBF_inputfile = filename
```

```
>>> JSON_outputfile = os.path.join(os.getcwd(),
...                                 'tests/output/LI/liechtenstein-191101.json')
```

Prefilter Phase

In the next step, a prefilter for all pipeline objects is defined. With the prefilter, we accept all way-items that have “man_made” as key and “pipeline” as value in their taglist. The white and black filter are left empty for the moment.

```
>>> prefilter    = {Node: {}, Way: {"man_made":["pipeline",],}, Relation: {}}
>>> whitefilter  = []
>>> blackfilter  = []
```

PLEASE NOTICE: You can also set “man_made”:True to accept items independently of a key value.

```
>>> [Data,_]=run_filter('noname',
...                       PBF_inputfile,
...                       JSON_outputfile,
...                       prefilter,
...                       whitefilter,
...                       blackfilter,
...                       NewPreFilterData=True,
...                       CreateElements=False,
...                       LoadElements=False,
...                       verbose=True)
```

Workaround:
Disable multiprocessing for
some Windows machines:
multiprocess=False

The prefilter returns the filter results to the `Data` dictionary. This means all OSM way-items with the tag “man_made”=“pipeline” are stored there. But not enough, additionally, all referenced node items of these pipelines are stored there too.

```
>>> len(Data['Node'])
13
>>> len(Data['Relation'])
0
>>> len(Data['Way'])
2
```

In this example, we have only found two pipelines and their correspondent 13 nodes.

Mainfilter Phase

In the next step we use `run_filter` to load the Data dictionary and specify the main filtering results. In this example, we use the blackfilter to exclude possible pipelines substations from our prefiltering results.

```
>>> blackfilter = [("pipeline", "substation"),]
```

We further only accept the drain pipelines that have the really great name “Wäschgräbli”.

```
>>> whitefilter = [(("waterway", "drain"), ("name", "Wäschgräbli")), ]
```

We initiate the mainfilter phase by setting `CreateElements=True`.

```
>>> [_, Elements]=run_filter('funny-waterway-pipelines',  
...                          PBF_inputfile,  
...                          JSON_outputfile,  
...                          prefilter,  
...                          whitefilter,  
...                          blackfilter,  
...                          NewPreFilterData=False,  
...                          CreateElements=True,  
...                          LoadElements=False,  
...                          verbose=True)
```

Accessing References and Relation Members

We see, that there is only one way-item left in the `Elements` dictionary, the other has been filtered out. There are no referenced nodes (or relation members) of the remaining way-item passed to the `Elements` dictionary.

```
>>> len(Elements['funny-waterway-pipelines']['Node'])
```

```
0
```

```
>>> len(Elements['funny-waterway-pipelines']['Relation'])
```

```
0
```

```
>>> len(Elements['funny-waterway-pipelines']['Way'])
```

```
1
```

Exporting to GeoJSON

However, `esy-osmfilter` comes with an `export` function for GeoJSON files (not implemented for relations yet) which will make things a lot easier:

```
>>> from esy.osmfilter import export_geojson
>>> export_geojson(Elements['funny-waterway-pipelines']['Way'],Data,
... filename='test.geojson',jsontype='Line')
{'location': 'underground', 'man_made': 'pipeline', 'name': 'Wäschgräble', 'waterway': 'drain'}
```

To visualize the output-file just open <http://geojson.io> and drag it on the screen.

Example: Prefilter for Gas Transport Data (Ways)

```
pre_filter = {
Node: {
Way: {
  "substance"      : ["gas", "cng"],
  "man_made"       : ["gasometer", "pipeline", "petroleum_well", "pumping_station",
                    "pipeline_marker", "pipeline_station", "storage_tank",
                    "gas_cavern"],
  "industrial"    : ["gas", "terminal", "cng"],
  "gas"           : ["station"],
  "content"       : ["gas", "cng"],
  "pipeline"      : ["substation", "marker", "valve", "pressure_control_station",
                    True],
  "storage"       : ["gas", "cng"],
  "seamark:type"  : ["pipeline_submarine"],
  "land_use"      : ["industrial:gas"]
  },
Relation: {},
}
```

Results: Europe 2019

Ways: 207393

Example: Whitefilter for Gas Transport Data

The whitefilter is a list of list of (key,value) tuples. If any list of (key,value) tuples is present, the item will pass (if it is not blocked by the blacklist at the same time).

```
whitefilter=[  
    ("man_made", "pipeline"), ("substance", "gas")),  
    ("man_made", "pipeline"), ("substance", "cng")),  
    ("man_made", "pipeline"), ("substance", "natural_gas")),  
    ("man_made", "pipeline"), ("pipeline:type", "natural_gas")),  
    ("man_made", "pipeline"), ("type", "gas")),  
    ("man_made", "pipeline"), ("type", "natural_gas")),  
    ("man_made", "pipeline"), ("type", "cng")),  
    ("man_made", "pipeline"), ("industrial", "gas")),  
    ("man_made", "pipeline"), ("industrial", "cng")),  
    ("man_made", "pipeline"), ("industrial", "natural_gas"))  
]
```

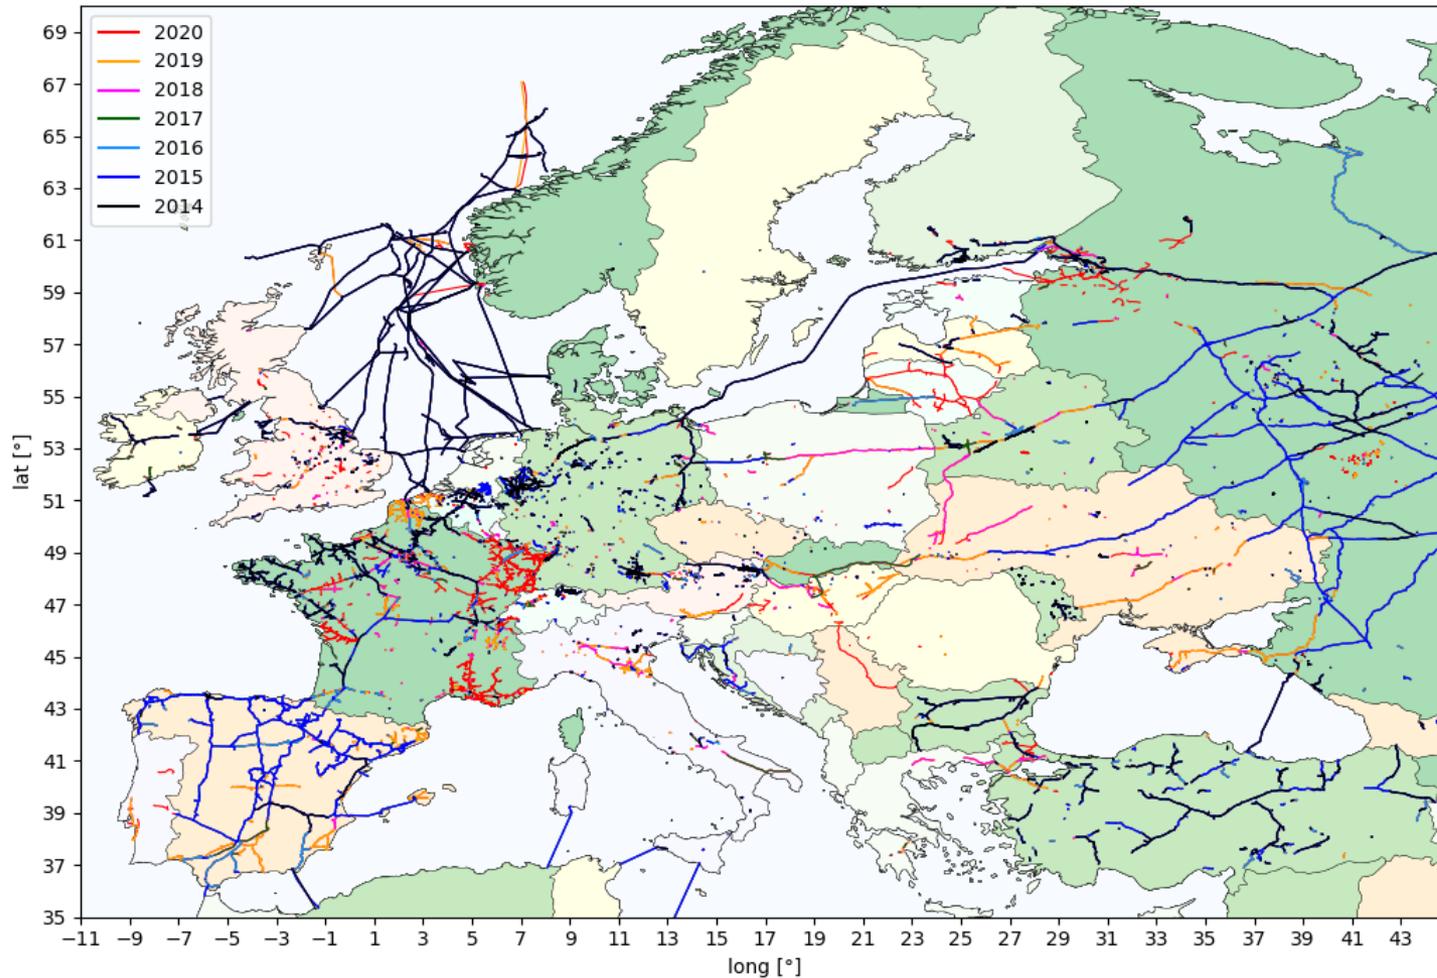

Example: Blackfilter for Gas Transport Data

The blackfilter is a list of (key,value) tuples, which will not let items pass if one of the (key,value) tuples is present. It is prioritized above the whitelist.

```
blackfilter=[
    ("pipeline", "substation"),
    ("substation", "distribution"),
    ('usage', 'distribution'),
    ('pipeline:type', 'water'),
    ('pipeline:type', 'sewer'),
    ("pumping_station", "water"),
    ("pumping_station", "sewage"),
    ('pumping_station', 'wastewater'),
    ("type", "wastewater"),
    ("type", "fuel"),
    ("type", "sewage"),
    ("type", "oil"),
    ("type", "water"),
    ("substance", "sewage"),
    ("substance", "water"),
    ("substance", "hot_water"),
    ("substance", "fuel"),
    ("substance", "wastewater"),
    ("substance", "rainwater"),
    ("substance", "drain"),
    ("substance", "heat"),
    ("substance", "gas, heat"),
    ("substance", "heat, gas"),
    ("substance", "ammonia"),
    ("substance", "ethylen"),
    ("substance", "oil")
]
```

Example: European Gas Transport Pipelines

European gas transport pipelines in OSM colored after entering year.
